Thailand Oil & Gas

Finding winners amidst oil & gas price uptrend

Limited oil price upside expected in 2022 on higher supply

According to the US Energy Information Administration (EIA), the high global oil price uptrend above USD70/bbl is likely to continue into 4Q21, considering 1) the limited impact of US shale oil exports on the global oil market; and 2) the post-economic reopening demand growth in the US and Europe is likely to outpace the supply growth from OPEC+. Meanwhile, OPEC expects the oil supply to outpace the oil demand in 1Q22 then reverse to an undersupply market in 2Q22 due to the projected strong demand at 102mbpd.

OPEC+ to remain a dominant oil producer into 2022

According to OPEC, the global oil demand is projected to surpass the supply by 1-2m barrels per day (mbpd) in 2H22, potentially driving the oil price higher or at least sustaining it at a high level above USD70/bbl in 4Q21. In contrast, the EIA forecasts that the global oil market will turn from an undersupply into an oversupply market starting in 1Q22 as it expects the oil supply growth to accelerate in 2022, mainly from US shale oil producers and rising oil production levels from the OPEC+ group.

Subpar US shale oil and gas production underscores high global oil & gas prices

As of 3 September 2021, according to the EIA, although the US active oil rig count has risen to 394 rigs, up from 181 rigs in 2020, the rig count number is historically low compared with other periods when crude oil futures prices were near similar levels (or at even lower prices). We think US shale oil production growth will remain low in 2H21 but should rebound meaningfully in 2022, thereby curbing the oil price upside in 2022. We think the gas price should decline and normalise in 2022 onward, with the spot LNG price in the range of USD6-8/mmbtu, closer to the LNG contract price. The strong demand growth for gas in the upcoming winter season as a heating oil should be partly offset by diesel and HSFO-based power plants, thanks to their relatively cheaper costs than LNG-based power plants.

Oil plays – PTTEP and TOP vs gas plays – BANPU and IVL

PTTEP and TOP are our top oil plays, given their high earnings exposures to the oil & gas prices (PTTEP as a producer of oil & gas) and as potential winners of the expected rebound in the demand for refined oil after the global reopening (TOP). For gas price plays, our top picks are BANPU and IVL as the winners of the current gas price uptrend. BANPU has 0.8bscfd of gas production capacity in the US and IVL has a large exposure to shale gas as a key feedstock for its 4mtpa IOD product group in the US. Additionally, the higher HH gas price should directly benefit BANPU's shale gas unit, while the high HH price should indirectly widen the margin of IVL's PET and PTA sold in North America. As one of three major producers of PET and PTA, IVL has high bargaining power to raise the contract and spot selling prices of its PET, PTA and IOD products produced from gas-based ethylene.

Oil price uptrend to begin by end-2021

According to the EIA, the high global oil price uptrend above USD70/bbl is likely to continue into 4Q21, considering 1) the limited impact of US shale oil exports on the global oil market; and 2) the post-economic reopening demand growth in the US and Europe is likely to outpace the supply growth from OPEC+.

The three global benchmark oil prices have moved closely in tandem with one another since 2H20 thanks to the supply cuts by OPEC+ and the structural oil production decline for shale oil produced in the US due to the limited resumption of oil rig operations, despite the rising West Texas Intermediate (WTI) benchmark oil price.

The oil futures of WTI, Brent, and Dubai have all remained in contango, dropping from the current USD72-76/bbl range for the November 2021 delivery down to USD60-65/bbl for the August 2024 delivery. This indicates that the market remains bearish on the oil price outlook in 2022-24 as a result of the projected higher supply from OPEC+ and increasing US shale oil production, in our view.

Exhibit 1: Crude oil price - Brent, Dubai, WTI

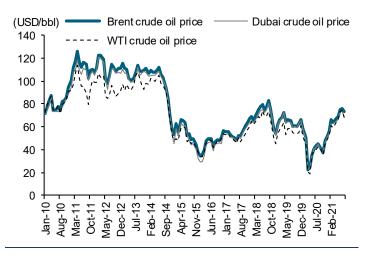

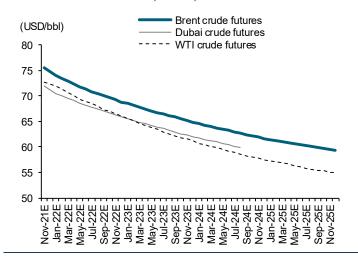

Exhibit 2: Futures - Brent, Dubai, WTI

Source: Bloomberg Prices as of 16 September 2021 Source: Bloomberg

OPEC is more bullish on oil price than the EIA

OPEC expects the oil supply to outpace the oil demand in 1Q22 then reverse to an undersupply market in 2Q22 due to the projected strong demand at 102mbpd, even higher than the pre-Covid-19 level of 101mbpd in 2019.

In contrast, the EIA forecasts that the global oil market will turn from an undersupply into an oversupply market starting in 1Q22 as it expects the oil supply growth to accelerate in 2022, mainly from US shale oil producers and rising oil production levels from the OPEC+ group.

Exhibit 3: World crude oil demand and supply forecast by OPEC

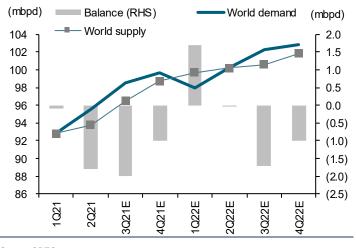

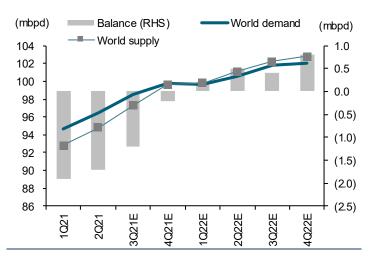

Exhibit 4: World crude oil demand and supply forecast by EIA

Source: OPEC Source: EIA

Our oil price view is much less positive than that of OPEC and the EIA, since we project the demand growth to be mostly and timely matched by the supply growth from both US shale oil producers and OPEC+. We maintain our oil price projection of USD65/60/60 per bbl for 2021-23 for Dubai and USD68/63/63 per bbl for Brent oil. We think the supply growth from US shale oil producers and OPEC+ will rise at a faster rate than OPEC+ and the EIA project.

FINANSIA 23 SEPTEMBER 2021

According to OPEC, the global oil demand is projected to surpass the supply by 1-2mbpd in 2H22, potentially driving the oil price higher or at least sustaining it at a high level above USD70/bbl in 4Q21. OPEC's oil production has been cut significantly since May 2020, dropping from 30-31mbpd down to 23-26mbpd during May 2020 to September 2021, leading the oil price to rise and stay above USD70/bbl since June 2020.

Exhibit 7: OPEC crude oil capacity, production, and utilisation

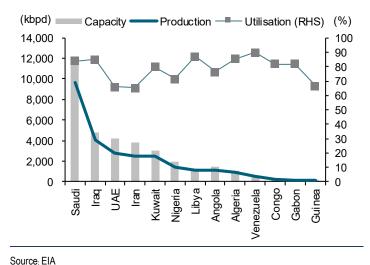

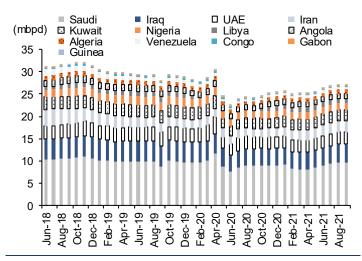

Exhibit: OPEC crude oil production

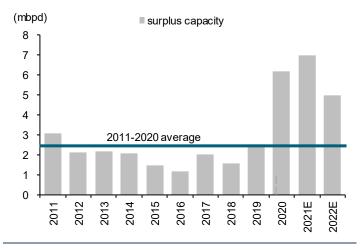

Source: EIA

However, starting from August 2021 and lasting until May 2022, according to OPEC+, the group has decided to gradually raise its oil production level by 0.4mbpd monthly. This, in our view, will effectively put the cap on the global oil price upside at below

USD80/bbl, even though we project the demand to recover back to the pre-Covid-19 level at over 100mbpd by mid-2022.

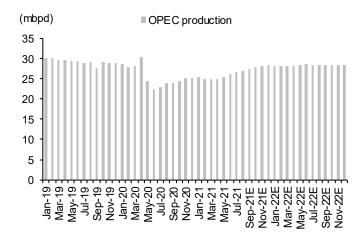

We also believe that if the global oil demand is stronger than expected and exceeds the supply increase in 2022, OPEC would still have a sufficient capacity surplus of over 6mbpd to fill any demand-supply gap left by other oil producers. As a result, we see a limited oil price upside in 2022-23 and expect a contango oil price curve during the same period, declining from the current USD70-75/bbl down to the USD55-65/bbl level in the next 24 months.

Exhibit 9: OPEC production

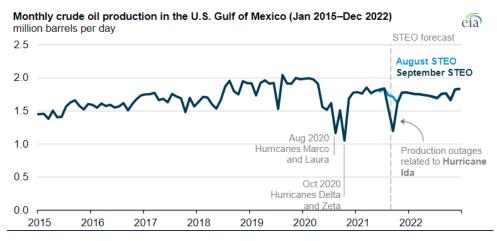

Source: EIA

US shale oil supply to remain subdued in 4Q21

US oil production remained low in 1H21. Despite the rising WTI oil price to USD70/bbl in 2H21, gross US crude oil exports in 1H21 averaged 3.0mbpd, down from 3.2mbpd 1H20. This was the first time exports had decreased since the end of the export ban in 2015, and was likely driven by the lower crude oil production, which decreased substantially in 2020 due to the economic response to the Covid-19 pandemic. Gross US crude oil imports also fell, decreasing from 6.2mbpd in 1H20 to 5.9mbpd in 1H21.

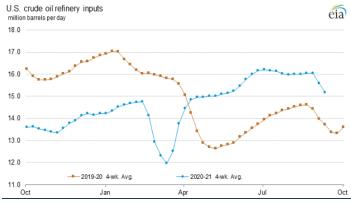

Exhibit 10: Hurricane Ida disrupted crude oil production and refining activity

Source: EIA

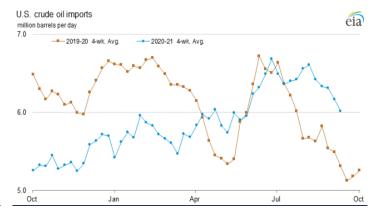

Hurricane Ida, which landed on southern Louisiana as a Category 4 hurricane on 29 August 2021, has disrupted US oil & gas production, with up to 96% of crude oil production and 94% of natural gas production in US federally administered areas of the Gulf of Mexico shutting down, according to estimates by the US Department of the Interior's Bureau of Safety and Environmental Enforcement. At least nine refineries shut down or reduced production levels, leading the EIA to cut its forecast for crude oil production and refinery runs in September 2021, according to the EIA's report, "Short-Term Energy Outlook". We, however, think that oil & gas production in the Gulf of Mexico will return to normal by October 2021, and will likely offset the slowdown in US oil production.

Exhibit 11: US refinery utilisation rate

Exhibit 12: US crude oil imports

Source: EIA

Declining number of DUCs could limit future oil production. Based on the EIA's "Drilling Productivity Report (DPR)", dated August 2021, 5,957 drilled but uncompleted wells (DUCs) were in the US in July 2021, the lowest for any month since November 2017. The decline in DUCs in most major US onshore oil-producing regions, especially in the Permian region, reflects more well completions and, at the same time, less new well drilling activity. The completion of more wells is increasing oil production in the Permian region, but the completions are reducing the DUC inventories, which could limit oil production growth in the US in the coming months.

Exhibit 13: Drilled but uncompleted wells by region (Jan-14 to Jul-21)

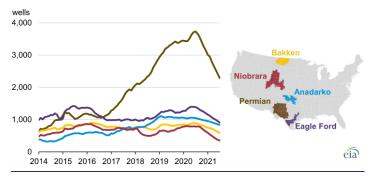

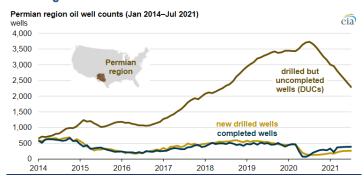

Exhibit 14: Number of drilled but uncompleted wells declining in the US

Source: EIA

Source: EIA

The two main stages in bringing a horizontally drilled, hydraulically fractured well online are drilling and completion. The drilling phase involves dispatching a drilling rig and crew, who then drill one or more wells on a pad site. The next phase, well completion, is typically performed by a separate crew and involves casing, cementing, perforating, and hydraulically fracturing the well for production. In general, the time between the drilling and completion stages is several months, leading to a significant inventory of DUCs that producers can maintain as working inventory to manage oil production.

Exhibit 15: Shale oil production per rig

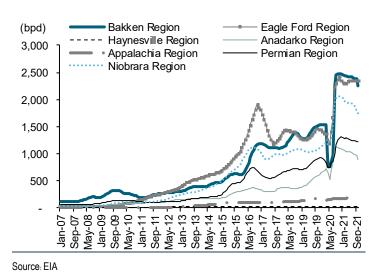

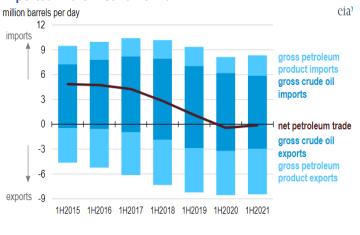

Exhibit 16: The US exported slightly more petroleum than it imported in the first half of 2021

Source: EIA

Indicators of new well drilling in the US remain subdued. As of 3 September 2021, according to the EIA, although the US active oil rig count has risen to 394 rigs, up from 181 rigs in 2020, the rig count number is historically low compared with other periods when crude oil futures prices were near similar levels (or at even lower prices). Rising rig counts typically lag four to six months behind a crude oil price increase. If drilling activity does not increase, then well completions and production may be limited because the inventory of DUCs continues to fall.

Hence, we think US shale oil production growth will remain low in 2H21 but should rebound meaningfully in 2022, thereby curbing the oil price upside in 2022. The EIA expects that the shale oil production will increase from 7.8mbpd in 2021 to 8.2-8.6mbpd in 2022.

Global gas market price spike likely to continue into 2022

The global LNG spot price recently spiked to over USD10/mmbtu, driven by the high freight cost and supply disruptions in the US and Russia. Meanwhile, the demand for gas has continued to strengthen as many power plants worldwide now consume gas as a major transitional fuel during the transition period from coal-fired power plants to renewable energy.

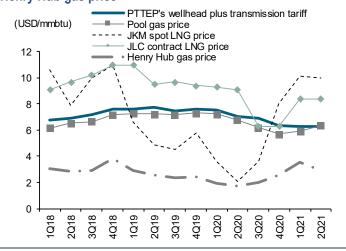

Exhibit 19: Three major benchmark gas prices

Source: Bloomberg

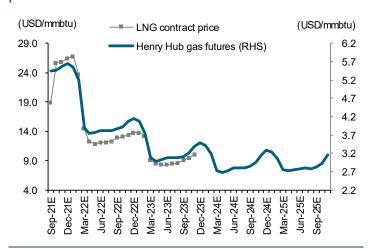

However, we expect the spot LNG price to decline and normalise to USD6-8/mmbtu, closer to the LNG contract price. The strong demand growth for gas in the upcoming winter season as a heating oil should be partly offset by diesel and high sulphur fuel oil (HSFO)-based power plants, thanks to their relatively cheaper costs than LNG-based power plants.

Exhibit 20: PTTEP gas price, pool gas price, LNG price, Henry Hub gas price

 $Sources: PTT, \, Bloomberg, \, EIA$

Exhibit 21: Futures – LNG contract price, Henry Hub gas price

Price as of 16 September 2021 Sources: Bloomberg

Meanwhile, the LNG supply from US exports should rise in 2022, given the strong LNG spot price and supply growth. Shale gas production in the US has stayed elevated at 83-85 billion standard cubic feet per day (bscfd), thanks to the rising gas production per rig across all gas producing areas. The currently high Henry Hub (HH) gas price in the US due to the transportation and production hiccups caused by hurricanes should decline by 1H22 when we project that the higher gas supply will improve the demand-supply balance of the gas market in the US.

Exhibit 22: US shale gas production by region

Valuations remain attractive

We prefer companies with high earnings exposures to the oil and gas prices, both directly and indirectly.

PTTEP and TOP are our top oil plays, given their high earnings exposures to the oil & gas prices (PTTEP as a producer of oil & gas) and as potential winners of the expected rebound in the demand for refined oil after the global reopening (TOP).

For gas price plays, our top picks are BANPU and IVL as the winners of the current gas price uptrend. BANPU has 0.8bscfd of gas production capacity in the US, and IVL has a large exposure to shale gas as a key feedstock for its 4mtpa integrated oxide and derivatives (IOD) product group in the US. Additionally, the higher HH gas price should directly benefit BANPU's shale gas unit, while the high HH price should indirectly widen the margin of IVL's PET and PTA sold in North America. As one of three major producers of PET and PTA, IVL has high bargaining power to raise the contract and spot selling prices of its PET, PTA and IOD products produced from gas-based ethylene.

The disclosure of the survey results of the Thai Institute of Directors Association ('IOD") regarding corporate governance is made pursuant to the policy of the Office of the Securities and Exchange Commission. The survey of the IOD is based on the information of a company listed on the Stock Exchange of Thailand and the Market for Alternative Investment disclosed to the public and able to be accessed by a general public investor. The result, therefore, is from the perspective of a third party. It is not an evaluation of operation and is not based on inside information.

The survey result is as of the date appearing in the Corporate Governance Report of Thai Listed Companies. As a result, the survey results may be changed after that date. FSS International Investment Advisory Company Limited does not confirm nor certify the accuracy of such survey results.

* CGR scoring should be considered with news regarding wrong doing of the company or director or executive of the company such unfair practice on securities trading, fraud,

Level

Certified

This level indicates practical participation with thoroughly examination in relation to the recommended procedures from the audit committee or the SEC's certified auditor, being a certified member of Thailand's Private Sector Collective Action Coalition Against Corruption programme (Thai CAC) or already passed examination to ensure independence from external parties.

Declared This level indicates determination to participate in the Thailand's Private Sector Collective Action Coalition Against Corruption programme (Thai CAC)

Disclaimer:

The disclosure of the Anti-Corruption Progress Indicators of a listed company on the Stock Exchange of Thailand, which is assessed by Thaipat Institute, is made in order to comply with the policy and sustainable development plan for the listed companies of the Office of the Securities and Exchange Commission. Thaipat Institute made this assessment based on the information received from the listed company, as stipulated in the form for the assessment of Anti-corruption which refers to the Annual Registration Statement (Form 56-1), Annual Report (Form 56-2), or other relevant documents or reports of such listed company. The assessment result is therefore made from the perspective of Thaipat Institute that is a third party. It is not an assessment of operation and is not based on any inside information. Since this assessment is only the assessment result as of the date appearing in the assessment result, it may be changed after that date or when there is any change to the relevant information. Nevertheless, FSS International Investment Advisory Company Limited does not confirm, verify, or certify the accuracy and completeness of the assessment results.

Note: Companies participating in Thailand's Private Sector Collective Action Coalition Against Corruption programme (Thai CAC) under Thai Institute of Directors (as of June 24, 2019) are categorised into: 1) companies that have declared their intention to join CAC, and; 2) companies certified by CAC.

Company	Ticker	Price	Rating	Valuation & Risks
PTT PCL	PTT TB	THB 39.50	BUY	Risks to our SoTP-based valuation are the oil price and potential earnings downside from government intervention.
PTT Explor & Prod	PTTEP TB	THB 112.50	BUY	Risks our TP, which is based on EV/EBITDA, are a sharp decline in oil price and a potential earnings downside from government intervention.
Thai Oil	TOP TB	THB 49.50	BUY	Downside risks to our EV/EBITDA-based TP are a sharp rise in oil price and weak demand for refined oil products.
Bangkok Aviation Fuel Services	BAFS TB	THB 30.50	BUY	Downside risk to our SoTP target price includes the slower than expected vaccination rate, which will lead to slower demand in tourism activities. Plus, the uncertainty in the fuel volume demand in the north, which can lead to volatility in income of FPT.
Star Petroleum Refining	SPRC TB	THB 9.00	BUY	TP is based on EV/EBITDA. Downside risks are a sharp rise in oil price and weak demand for refined oil products.
Bangchak Corp	BCP TB	THB 26.25	BUY	The downside risks to our SoTP-based TP include: 1) lower-than-expected demand for petroleum products; 2) higher crude premiums; and 3) unplanned shutdowns of the company's refinery plants.
Esso Thailand	ESSO TB	THB 8.00	BUY	The downside risks to our SoTP-based TP on ESSO include 1) lower-than-expected demand for petroleum products, 2) a higher crude premium, and 3) unplanned shutdowns of its refinery and petrochemical plants.
PTT Global Chemical	PTTGC TB	THB 60.00	BUY	The key downside risks to our EV/EBITDA-based TP are the weaker-than-expected HDPE price and HDPE-naphtha margin.
IRPC PCL	IRPC TB	THB 4.00	BUY	Key risks to our positive view and EV/EBITDA-based target price are weaker-than- expected oil product demand growth and lower-than-expected PP-naphtha and SM- benzene margins.
Tipco Asphalt	TASCO TB	THB 18.00	BUY	Downside risks to our EV/EBITDA multiple based TP include 1) a lower asphalt margin due to a oversupply in Asia on the back of faster recovery of utilisation rate for global refiners; and 2) a lower-than-expected supply of alternative crudes and asphalt.
Indorama Ventures	IVL TB	THB 43.75	BUY	The key downside risks to our EV/EBITDA-based TP are weaker-than-expected margins for PX-PTA and PET-PTA, lower demand for polyester, and delays in IVL's projects.
Banpu	BANPU TB	THB 12.50	BUY	We see downside risks to our SoTP-based TP from lower coal prices, higher diesel costs and any unplanned shutdowns of its power plants. We see upside risks from higher coal prices, higher gas prices and lower costs.

Additional Disclosures

Target price history, stock price charts, valuation and risk details, and equity rating histories applicable to each company rated in this report is available in our most recently published reports. You can contact the analyst named on the front of this note or your representative at Finansia Syrus Securities Public Company Limited

FSSIA may incorporate the recommendations and target prices of companies currently covered by FSS Research into equity research reports, denoted by an 'FSS' before the recommendation. FSS Research is part of Finansia Syrus Securities Public Company Limited, which is the parent company of FSSIA.

All share prices are as at market close on 22-Sep-2021 unless otherwise stated.

RECOMMENDATION STRUCTURE

Stock ratings

Stock ratings are based on absolute upside or downside, which we define as (target price* - current price) / current price.

BUY (B). The upside is 10% or more.

HOLD (H). The upside or downside is less than 10%.

REDUCE (R). The downside is 10% or more.

Unless otherwise specified, these recommendations are set with a 12-month horizon. Thus, it is possible that future price volatility may cause a temporary mismatch between upside/downside for a stock based on market price and the formal recommendation.

* In most cases, the target price will equal the analyst's assessment of the current fair value of the stock. However, if the analyst doesn't think the market will reassess the stock over the specified time horizon due to a lack of events or catalysts, then the target price may differ from fair value. In most cases, therefore, our recommendation is an assessment of the mismatch between current market price and our assessment of current fair value.

Industry Recommendations

Overweight. The analyst expects the fundamental conditions of the sector to be positive over the next 12 months.

Neutral. The analyst expects the fundamental conditions of the sector to be maintained over the next 12 months.

Underweight. The analyst expects the fundamental conditions of the sector to be negative over the next 12 months.

Country (Strategy) Recommendations

Overweight (O). Over the next 12 months, the analyst expects the market to score positively on two or more of the criteria used to determine market recommendations: index returns relative to the regional benchmark, index sharpe ratio relative to the regional benchmark and index returns relative to the market cost of equity.

Neutral (N). Over the next 12 months, the analyst expects the market to score positively on one of the criteria used to determine market recommendations: index returns relative to the regional benchmark, index sharpe ratio relative to the regional benchmark and index returns relative to the market cost of equity.

Underweight (U). Over the next 12 months, the analyst does not expect the market to score positively on any of the criteria used to determine market recommendations: index returns relative to the regional benchmark, index sharpe ratio relative to the regional benchmark and index returns relative to the market cost of equity.
